

Pulse Tidal presented at the May 2009 OION meeting. The company successfully closed their investment round in November, with over £700k raised, which included equity investment from one OION angel investor.

Pulse Tidal has developed a technology which is able to generate electricity from flowing water caused by the tides. The tides represent a vast, predictable and renewable source of energy.

The technology enables Pulse Tidal to install tidal power machines in shallow water, where costs are lower and connection to the power grid is straightforward, potentially offering the most attractive tidal power development approach.
